

Description

EleMech supplied three (3) Hauler Stations, each with an industrial keypad with magnetic card reader. The card reader is for future use.

Hauler is prompted to enter a truck ID that was provided by the facility during permitting. Hauler also enters a PIN for security. PIN in this case was auto generated by PortALogic when the truck was added to the system.

Plant specification also requested that the hauler be able to manually enter the gallons as reported on the manifest. Since a flow meter is not installed, the entered gallons are used for billing purposes.

Once unloaded, a receipt is printed for the hauler's record and the data is automatically uploaded into PortALogic.

Site has three (3) installs of PortALogic Client, including an install for the IT department, local trailer that an attendant uses, and another for permitting an officer that is located downtown. All instances are operated on a common network to the server and a second network gated to the hauler station controllers.

This site can register and manage up to 2,500 truck accounts with PortALogic!
