

# Septage Receiving Solution

## A Closer Look at PortALogic's Software

PortALogic Client is a user friendly software package capable of displaying nearly every aspect of the septage receiving process. New haulers and trucks can be added or removed in seconds. All data received at the Hauler Station is clearly displayed and can be edited, deleted, or compiled into easy to understand reports. The software can be installed on any number of networked computers at no additional charge.

### Add Customer

Users can enter a new customer into the software; this is the first step in allowing a truck access to the system.

### Enter Payment

Users can enter payments on selected customers and specify fields such as amount, date, and description.

### Waste Types

Users are able to designate specific waste type IDs as well as their descriptions.

### Add Truck

Once a customer is created and selected, a truck can be assigned to that customer. Users can assign a truck number and a PIN number for station access.

### Refresh Data

The contents of the Customer List and Transactions can be refreshed with one click. This function is useful for retrieving up-to-the-minute details.

### Alarms

Users are able to configure types of equipment faults and alarm conditions that PortALogic Server can recognize and respond to.

### Add Order

If needed, users can manually add in order and specify volume, ph level, customer truck, waste type, receipt number, and date.

### HMI

Users can view plant HMI software by clicking the integrated HMI link.

### Add Lab Info

The Lab Info is optional and shows all user entered chemical data for each of the hauls.
